

TSPLUS 2FA[®]

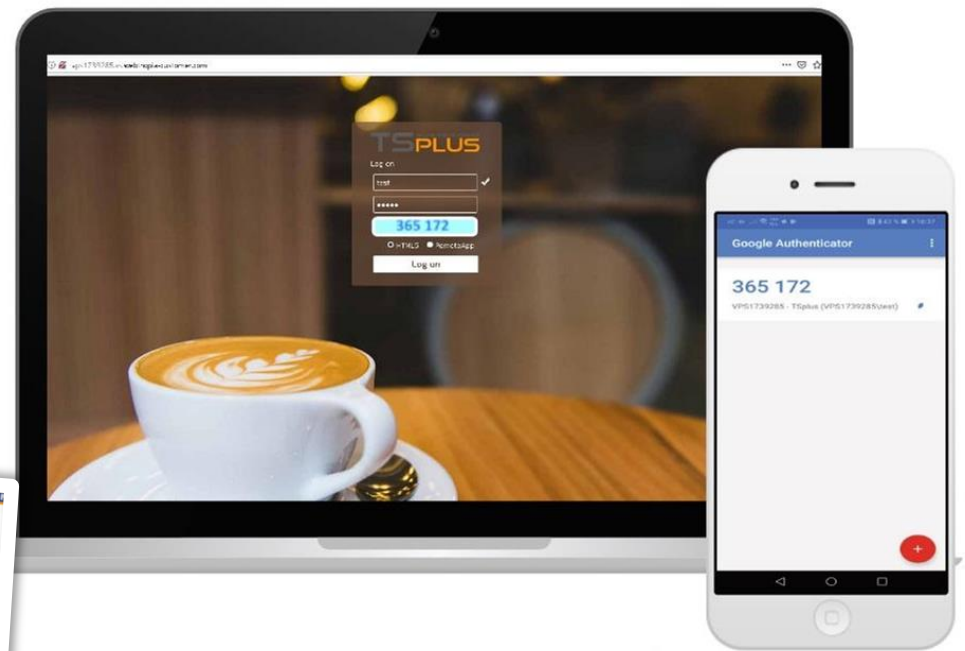

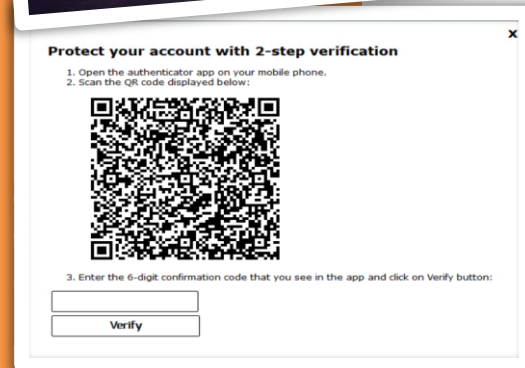

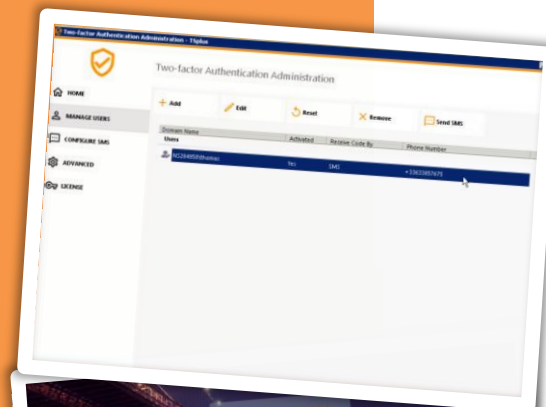

Relying on just usernames and passwords is no longer safe!

Your employees are using TSplus[®] to work from home, using their own devices to share personal and corporate data online, and then using those same devices for social media and other less secure communications and transmissions.

Simultaneously, viruses designed for broad attacks on everybody are being replaced by malware customized to target specific companies or individuals. The barriers-to-entry and costs for hackers have fallen precipitously and the nature of the threat is always changing.

All it takes is one weak link in the chain, one impatient or exhausted employee, to leave your organization vulnerable to attack.

If you're an admin responsible for cybersecurity in a large organization, you need to respond to this increased threat with the most secure tools available.

ENHANCE THE SECURITY OF YOUR TSPLUS WEB PORTAL

TSplus 2FA[®] provides dynamic passcodes and multi-factor authentication to secure your Web Portal.

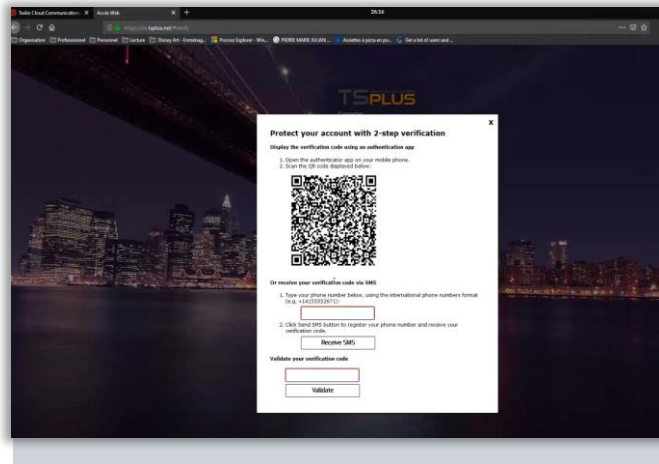

Whether logging into your work emails or company apps, TSplus 2FA[®] allows you to use your mobile device to access your remote server securely and conveniently.

2FA[®] combines two different authentication factors to complete the login process and to achieve a greater level of security:

- The user credentials (Log-on/Password)
- A secure code (generated by the authenticator app on Smartphone /Tablet /Smartwatch)

Users will always need both pieces of information to log in their session.

THE IDENTITY AND ACCESS TOOL YOU NEED

Extra Layer of Security

TSplus 2FA® drastically reduces the risk of hacks, providing strong and frictionless codes for mobile and web portal authentication. With a single touch users can generate dynamic and one-time number combinations (the verification codes are generally reset every 30 seconds) to supplement static usernames and passwords with added security.

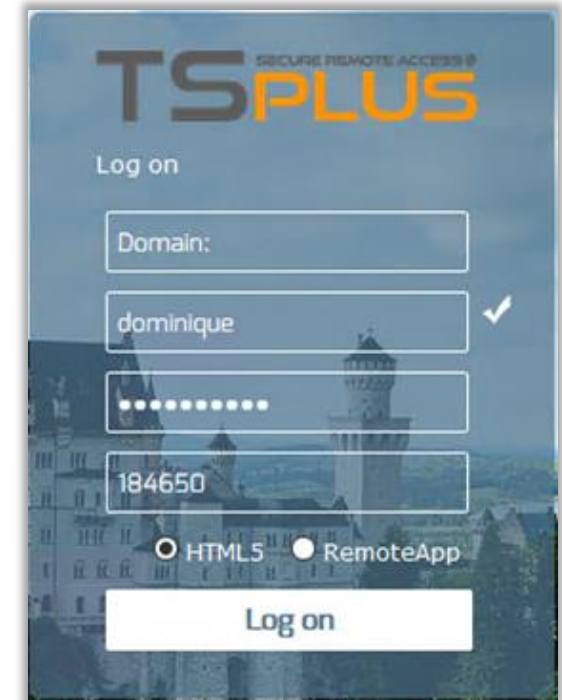

Easy to Set-up and Use

It's a two steps verification process:

- **One** - At the first connection, the user will need to configure a TSplus account on their authenticator app using the QR Code displayed on the web portal.
- **Two** - The user will always have to enter two pieces of information: their credentials and the security code generated in by the authenticator app on their device.

Available offline and on Multiple Devices

TSplus 2FA® can be used offline without any extra hardware required. **TSplus 2FA**® allows users to authenticate using codes generated by their device even when those devices are offline. This avoids SMS and voice security issues.

TSplus 2FA is compatible with a wide range of platforms.

Pre-requisites on the user's side are:

- ✓ A personal portable device, such as a Smartphone
- ✓ An authenticator app installed on this device. The following apps can be used to proceed:
 - [Authy](#)
 - [Google Authenticator](#)
 - [Microsoft Authenticator](#)

Pre-requisites on the server side are:

- ✓ [TSplus Mobile Web or Enterprise installed](#)
- ✓ Only with TSplus Web Portal:
 - TSplus Web Mobile Edition
 - TSplus Enterprise Edition

Add an Extra Layer of Security.

TSplus 2FA is your key to a secure world!
